

ABSTRACT

Systems, methodologies, media, and other embodiments associated with processing point-to-point transactions that are not be processed into bus model transactions by a virtual bus interface configured to convert point-to-point transactions into bus-type transactions are described. One exemplary system embodiment includes a detection logic that facilitates identifying that a point-to-point transaction is a transaction type that is not be processed into a bus model transaction and a tracking logic that facilitates tracking the transaction and related packets through the virtual bus interface and that also facilitates suppressing generating a bus model transaction from a point-to-point transaction.
